Excerpt from Fruit and Its Cultivation: The Cultivation of All Kinds of Hardy Fruits in Garden and Orchard, Including Planting, Pruning, Training and Propagation, Selections of Varieties, and Descriptions of Insect and Fungoid Pests, With Remedies for Their Eradication

The cultivation of hardy fruits in gardens, orchards, and plantations is a fascinating, and, in favourable seasons, a profitable pursuit. During the last century it engaged the attention of many distinguished men, such as the late Thomas Andrew Knight and Dr. Hogg among amateurs, and Mr. Thomas Rivers and others among trade growers, to whom we owe many of the most popular varieties of fruit grown at the present day. To them also we owe the introduction of the dwarfing stocks by means of which apples and pears especially can be grown as cordons or bushes in a more limited space than was possible in former times. Hence we find dwarf fruit trees now being grown extensively and profitably in small gardens, as well as in large plantations, these coming into bearing at a much earlier period of their life than the erstwhile standard-trained trees of generations ago.

There are few small gardens indeed in which it is not possible to grow luscious and useful fruits successfully. The Blackberry and the Loganberry, for example, may be easily and profitably grown on fences, walls, or on arches; horizontally-trained cordon apples and pears may form a pleasing fringe to the garden paths; vertical and obliquely-trained cordon plums, cherries, apples, pears, gooseberry, and currant trees clothe an archway or pergola, or cover a low wall or fence profitably; bush-trained apples, pears, plums, cherries, gooseberries, and currants grown around the margins of paths or in small plots; in each case, if intelligently cared for, producing an annual crop of delicious fruits.
